Generalized quantifiers, also called *Lindström quantifiers* (1966) are to first-order logic what **oracles** are to Turing machines.

Definition

Let $\tau = \{R_1, \dots, R_m\}$ and \mathcal{K} be a class of τ -structures. Then $\mathbf{Q}_{\mathcal{K}}$ is the *generalized quantifier* defining \mathcal{K} . Its *arity* is the maximum arity of any relation in τ .

Definition

Let $\tau = \{R_1, \dots, R_m\}$ and \mathcal{K} be a class of τ -structures. Then $Q_{\mathcal{K}}$ is the *generalized quantifier* defining \mathcal{K} . Its *arity* is the maximum arity of any relation in τ .

Usage: Let $\Psi = (\psi_{R_1}(\bar{y}), \dots, \psi_{R_m}(\bar{y}))$ be a tuple of σ -formulas, one for each $R_i \in \tau$.

Let \mathbf{A} be a σ -structure. Then $\mathbf{A} \models Q_{\mathcal{K}}\bar{y}.\Psi$ if and only if $\Psi(\mathbf{A}) \in \mathcal{K}$.

Definition

Let $\tau = \{R_1, \dots, R_m\}$ and \mathcal{K} be a class of τ -structures. Then $Q_{\mathcal{K}}$ is the *generalized quantifier* defining \mathcal{K} . Its *arity* is the maximum arity of any relation in τ .

Usage: Let $\Psi = (\psi_{R_1}(\vec{y}), \dots, \psi_{R_m}(\vec{y}))$ be a tuple of σ -formulas, one for each $R_j \in \tau$.

Let \mathbf{A} be a σ -structure. Then $\mathbf{A} \models Q_{\mathcal{K}}\vec{y}.\Psi$ if and only if $\underbrace{\Psi(\mathbf{A})}_{=(\mathbf{A}, (\psi_{R_j}^{\mathbf{A}})_{R_j \in \tau})} \in \mathcal{K}$.

Example (Counting quantifiers)

Express the **counting quantifier** $\exists^{=t}x$ as a (unary) generalized quantifier $Q_{\mathcal{K}}$:

Let U be a unary relation symbol, and \mathcal{K} be the class of all $\{U\}$ -structures with $|U| = t$.

Example (Counting quantifiers)

Express the **counting quantifier** $\exists^{=t}x$ as a (unary) generalized quantifier $Q_{\mathcal{K}}$:
Let U be a unary relation symbol, and \mathcal{K} be the class of all $\{U\}$ -structures with $|U| = t$.

$$\exists^{=t}x.\varphi(x) \equiv Q_{\mathcal{K}}x.(\varphi(x)).$$

Goal: Systematically understand and compare expressive power of different extensions of FO.

Studying extensions of FO through the lens of generalized quantifiers

Goal: Systematically understand and compare expressive power of different extensions of FO.

⇒ Define *classes* \mathcal{Q} of *generalized quantifiers*, and study $\mathcal{L}(\mathcal{Q})$, the extension of FO with all quantifiers in \mathcal{Q} .

Studying extensions of FO through the lens of generalized quantifiers

Goal: Systematically understand and compare expressive power of different extensions of FO.

⇒ Define *classes* \mathcal{Q} of *generalized quantifiers*, and study $\mathcal{L}(\mathcal{Q})$, the extension of FO with all quantifiers in \mathcal{Q} .

Classic example: Let \mathcal{Q}_r be the class of all quantifiers of *arity* $\leq r$.

Theorem (Hella, 1992)

For every $r \in \mathbb{N}$,

$$\mathcal{L}(\mathcal{Q}_r) \not\leq \mathcal{L}(\mathcal{Q}_{r+1}).$$

Another way of structuring generalized quantifiers is by *closure conditions*:

- For every generalized quantifier $Q_{\mathcal{K}}$, \mathcal{K} is closed under isomorphisms.

Another way of structuring generalized quantifiers is by *closure conditions*:

- For every generalized quantifier $Q_{\mathcal{K}}$, \mathcal{K} is closed under isomorphisms.
- Closure under **linear-algebraic relaxations of isomorphism** yields *linear-algebraic logic* (\approx rank logic).

Another way of structuring generalized quantifiers is by *closure conditions*:

- For every generalized quantifier $Q_{\mathcal{K}}$, \mathcal{K} is closed under isomorphisms.
- Closure under **linear-algebraic relaxations of isomorphism** yields *linear-algebraic logic* (\approx rank logic).
- [Dawar, Hella, CSL'24]: Quantifiers closed under **partial polymorphisms**.

Definition

An l -ary *polymorphism* from a structure \mathbf{A} to a structure \mathbf{B} is a homomorphism from \mathbf{A}^l to \mathbf{B} .

Definition

An l -ary *polymorphism* from a structure **A** to a structure **B** is a homomorphism from \mathbf{A}^l to **B**.

Polymorphisms are used in the complexity classification of **constraint satisfaction problems (CSP)**.

Definition

An ℓ -ary *polymorphism* from a structure **A** to a structure **B** is a homomorphism from \mathbf{A}^ℓ to **B**.

Polymorphisms are used in the complexity classification of **constraint satisfaction problems (CSP)**.

Identities satisfied by polymorphism p of the solution domain determine the complexity:

- **Near-unanimity:** $p(x, x, \dots, x, y) = p(x, x, \dots, y, x) = p(x, y, \dots, x, x) = p(y, x, \dots, x, x) = x$
⇒ CSP has bounded width (very easy).
- **Maltsev:** $p(x, x, y) = p(y, x, x) = y$
⇒ CSP in PTIME (admits basis computation).

Definition

An ℓ -ary *polymorphism* from a structure **A** to a structure **B** is a homomorphism from \mathbf{A}^ℓ to **B**.

Polymorphisms are used in the complexity classification of **constraint satisfaction problems (CSP)**.

Identities satisfied by polymorphism p of the solution domain determine the complexity:

- **Near-unanimity:** $p(x, x, \dots, x, y) = p(x, x, \dots, y, x) = p(x, y, \dots, x, x) = p(y, x, \dots, x, x) = x$
⇒ CSP has bounded width (very easy).
- **Maltsev:** $p(x, x, y) = p(y, x, x) = y$
⇒ CSP in PTIME (admits basis computation).

We consider *partial* near-unanimity/Maltsev polymorphisms:

Only defined when the arguments match the pattern of the identities.

Logics with generalized quantifiers closed under partial polymorphisms

$\mathcal{L}(Q_r^{Ne})$

FO with all quantifiers of **arity** $\leq r$ closed
under ℓ -ary partial **near-unanimity** poly-
morphisms

$\mathcal{L}(Q_r^M)$

FO with all quantifiers of **arity** $\leq r$ closed
under partial **Maltsev** polymorphisms

Logics with generalized quantifiers closed under partial polymorphisms

$\mathcal{L}(\mathcal{Q}_r^{\mathcal{N}_\ell})$

FO with all quantifiers of **arity** $\leq r$ closed
under ℓ -**ary** partial **near-unanimity** poly-
morphisms

$\mathcal{L}(\mathcal{Q}_r^{\mathcal{M}})$

FO with all quantifiers of **arity** $\leq r$ closed
under partial **Maltsev** polymorphisms

- **CSPs** with near-unanimity/Maltsev polymorphisms can be solved in these logics, but much more... (even NP-complete problems)

Logics with generalized quantifiers closed under partial polymorphisms

$\mathcal{L}(Q_r^{\mathcal{N}_\ell})$

FO with all quantifiers of **arity** $\leq r$ closed under ℓ -ary partial **near-unanimity** polymorphisms

$\mathcal{L}(Q_r^{\mathcal{M}})$

FO with all quantifiers of **arity** $\leq r$ closed under partial **Maltsev** polymorphisms

- **CSPs** with near-unanimity/Maltsev polymorphisms can be solved in these logics, but much more... (even NP-complete problems)
- [Dawar, Hella '24] introduced games for these logics and proved an **arity hierarchy** for $\mathcal{L}(Q_r^{\mathcal{N}_\ell})$ in terms of ℓ .

Logics with generalized quantifiers closed under partial polymorphisms

- **In this work:** Interplay between ℓ and r ?

Theorem (CSL'26)

For every $r \geq 3$,

$$\mathcal{L}(\mathcal{Q}_r^{M_r}) \equiv \mathcal{L}(\mathcal{Q}_{r-1}).$$

Theorem (CSL'26)

For every $r \geq 3$,

$$\mathcal{L}(Q_r^{N_r}) \equiv \mathcal{L}(Q_{r-1}).$$

Do the quantifiers $Q_r^{N_r}$ ever give us something else than *all* generalized quantifiers of a fixed arity?

Theorem (CSL'26)

For every $r \geq 3$,

$$\mathcal{L}(Q_r^{\mathcal{N}_r}) \equiv \mathcal{L}(Q_{r-1}).$$

Do the quantifiers $Q_r^{\mathcal{N}_r}$ ever give us something else than *all* generalized quantifiers of a fixed arity?

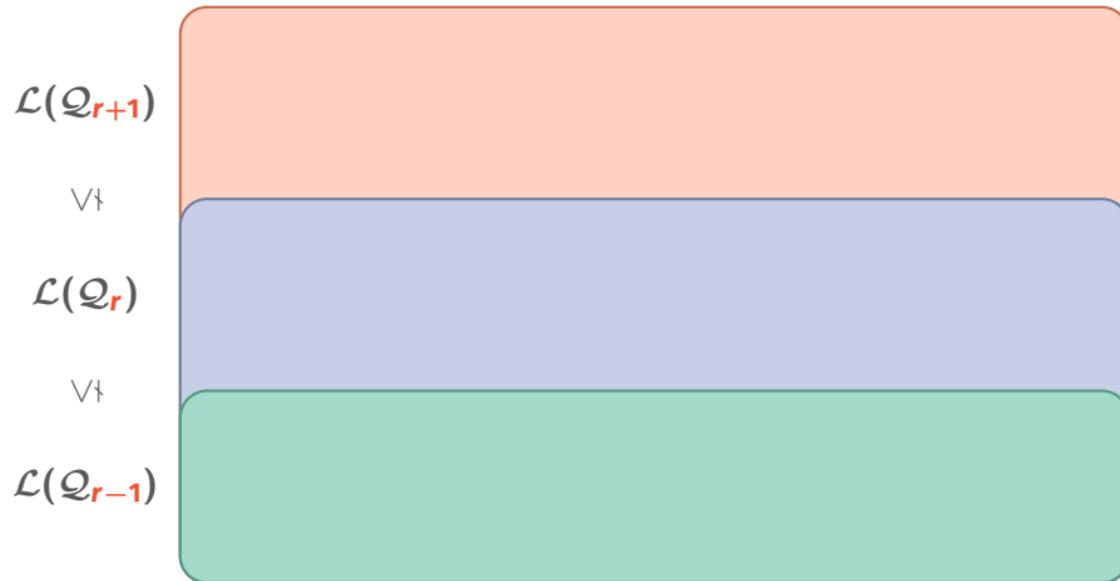

They do!

Theorem (CSL'26)

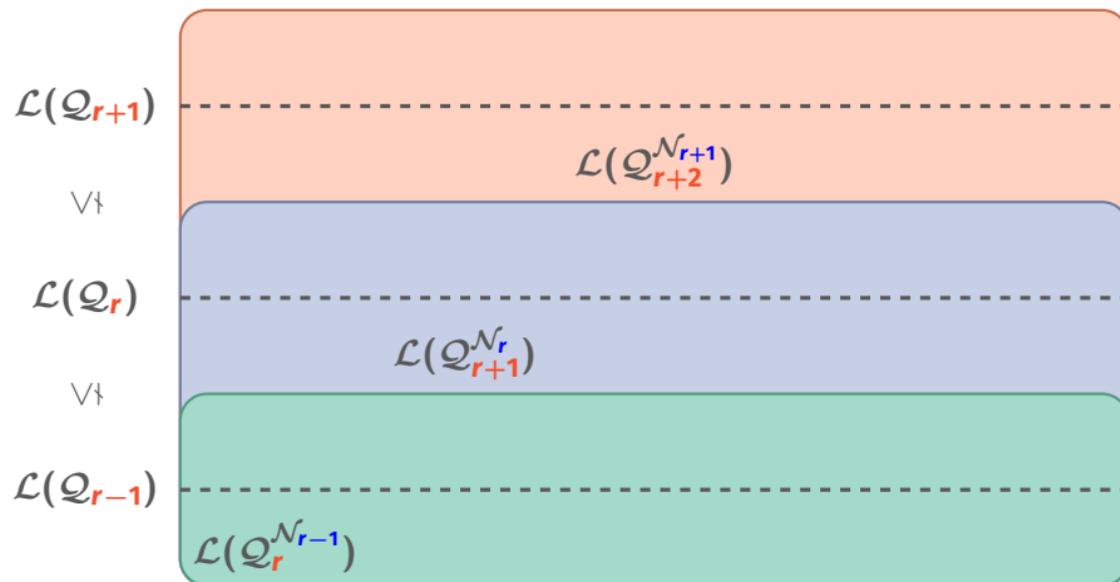

For every $r \geq 3$,

$$\mathcal{L}(Q_{r-1}) \subsetneq \mathcal{L}(Q_{r+1}^{\mathcal{N}_r}) \subsetneq \mathcal{L}(Q_r).$$

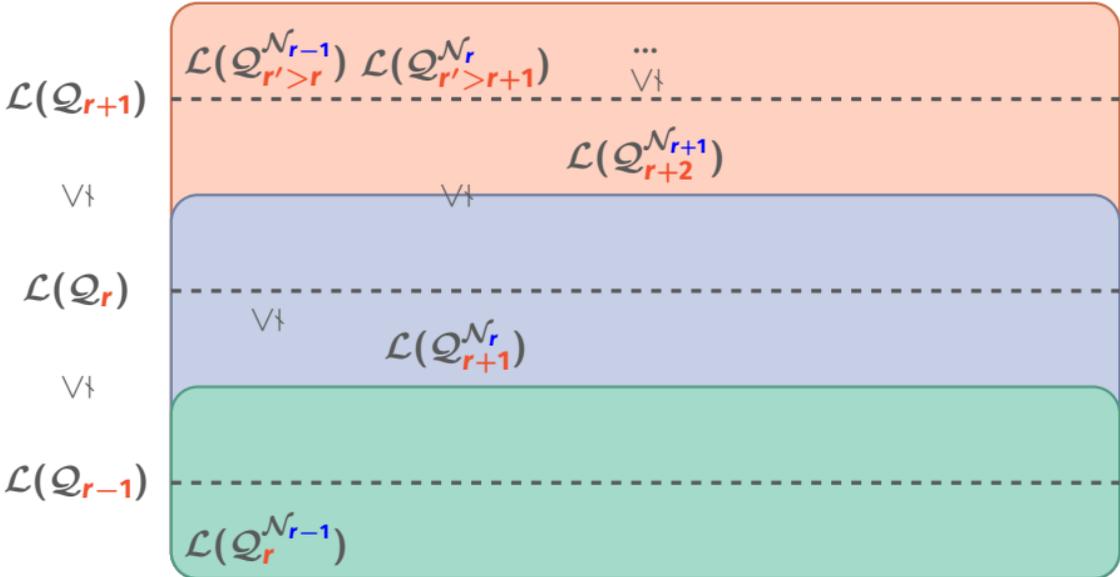

Arity hierarchies

Arity hierarchies

Arity hierarchies

- For partial **Maltsev**-closed quantifiers, an arity hierarchy follows from [Hella, '92]:
 $\mathcal{L}(Q_r^M) \not\leq \mathcal{L}(Q_{r+1}^M)$.

A note on Maltsev-closed quantifiers

- For partial **Maltsev**-closed quantifiers, an arity hierarchy follows from [Hella, '92]:
 $\mathcal{L}(Q_r^M) \leq \mathcal{L}(Q_{r+1}^M)$.
- **Open problem:** Separate $\mathcal{L}(Q_r^M)$ from $\mathcal{L}(Q_r)$.

A note on Maltsev-closed quantifiers

- For partial **Maltsev**-closed quantifiers, an arity hierarchy follows from [Hella, '92]:
 $\mathcal{L}(Q_r^M) \not\leq \mathcal{L}(Q_{r+1}^M)$.
- **Open problem:** Separate $\mathcal{L}(Q_r^M)$ from $\mathcal{L}(Q_r)$.
- This requires a better idea than the usual *Cai-Fürer-Immerman* constructions because these encode problems over Abelian groups having a Maltsev polymorphism.

A note on Maltsev-closed quantifiers

- For partial **Maltsev**-closed quantifiers, an arity hierarchy follows from [Hella, '92]:
 $\mathcal{L}(Q_r^M) \not\leq \mathcal{L}(Q_{r+1}^M)$.
- **Open problem:** Separate $\mathcal{L}(Q_r^M)$ from $\mathcal{L}(Q_r)$.
- This requires a better idea than the usual *Cai-Fürer-Immerman* constructions because these encode problems over Abelian groups having a Maltsev polymorphism.
- **Partial success:**

A note on Maltsev-closed quantifiers

- For partial **Maltsev**-closed quantifiers, an arity hierarchy follows from [Hella, '92]:
 $\mathcal{L}(Q_r^M) \not\leq \mathcal{L}(Q_{r+1}^M)$.

- This requires a better idea than the usual *Cai-Fürer-Immerman* constructions because these encode problems over Abelian groups having a Maltsev polymorphism.
- **Partial success:**

Theorem (CSL'26)

The *k*-variable fragments \mathcal{L}^k are separated:

$$\mathcal{L}^k(Q_k^M) \not\leq \mathcal{L}^k(Q_k).$$
